**Titl :** Reduction of malodour

**FIELD OF THE INVENTION**

The present invention relates to the use of an oxidoreductase  
5 for removing malodour, a malodour reducing composition, and  
products comprising a composition of the invention.

**BACKGROUND OF THE INVENTION**

It is well established that malodour may be caused by a  
10 number of compounds, such as volatile sulphur compounds (VSC),  
nitrogen containing compounds, short fatty acids etc.

Volatile Sulphur Compounds (VSC)

**Bad Breath:**

15 Malodour in the form of a bad breath emanating from the oral  
cavity is typically a consequence of volatile sulphur compounds  
(VSC). VSCs are produced by oral anaerobic Gram-positive bacteria  
by degradation of sulphur containing proteinaceous substrates in  
the saliva. The VSCs are released into the oral environment where  
20 they are mixed with air expired from the lungs resulting in a  
unpleasant odour coming out of the mouth. The above mentioned  
proteinaceous substrates may be owing to the intake of foods,  
such as meat, fish, spices, vegetables, dairy products etc.  
Volatile Sulphur Compounds such as for instance diallyl  
25 sulfide, (a thioether) can be found in e.g. garlic being well  
known for causing a repellent bad breath.

**Burned flavour:**

When heat treating certain foods, such as UHT-treating  
30 milk, a "burned" flavour caused by Volatile Sulphide Compounds  
may arise.

Examples of VSCs are hydrogen sulfide ( $H_2S$ ), dimethyl sulfide  
( $CH_3SCH_3$ ), diallyl sulfide, and the one being regarded as the  
most potent methyl mercaptan ( $CH_3SH$ ) also called methanethiol.

### Nitrogen containing compounds

Nitrogen containing compound such as ammonia, indole, skatole and a number of amines are also well-known to give a bad smell. An amine such as trimethylamine gives a fishy smell.

5

Diapers and the like:

A source of nitrogen containing compounds are urine, faeces and blood giving a bad smell known by most people from either soiled diapers or other hygiene products, such as adult  
10 incontinence products, training pants, feminine napkins, tampons and the like.

The bad smell coming from diapers and the like is typically a consequence of growth of bacteria, especially *Escherichia coli*, *Enterococcus faecalis* and *Proteus mirabilis*, present on the  
15 skin in the perineum (the region between the anus and the external sexual organs). All strains of *Proteus* form the enzyme urease during their metabolism. Urease has the ability to rapidly break down urea (constituting about 2% of human urine) into ammonia causing an unpleasant odour.

20

### Short fatty acids

Short fatty acids, such as butyric acid (C4), are also known to give a malodour. After having worn shoes for a whole long warm day most people know the bad smell of perspiring feet caused by  
25 the short fatty acids such as butyric acid.

Further, clothes washed with a laundry detergent comprising a lipase sometimes have an unattractive odour resembling the odour of spit-up from babies. This malodour is believed to arise when the lipase degradation product of triglyceride containing soils  
30 on the fabric is not completely removed during the wash or rinse cycle. Said degradation product consists of short free fatty acids (e.g. butyric acid).

### Removal or reduction of malodour

35 A number of odour controlling agent and systems have been

described in the literature. For instance, carbon is e.g. in the form of activated carbon well-known for its ability to adsorb odoriferous molecules.

US patent no. 5,593,398 discloses protective underwear with  
5 malodorous flatus filter comprising activated carbon as the malodour controlling agent

Zeolitic materials have been shown to be effective against malodour associated with body fluids.

JP patent application no. 02068117 relates to deodorising  
10 means e.g. for diapers containing zeolite, copper and activated charcoal.

US patent no. 4,026,814 concerns a soap with a reduced tendency to generate malodours during storage. The soap comprises an enzyme system which contains an oxido-reductase enzyme such as  
15 alcohol dehydrogenase and/or aldehyde dehydrogenase, and a hydrogen acceptor selected from the group of nicotinamide-adenine-dinucleotide and/or nicotinamide-adenine-dinucleotide phosphate.

JP patent application no. 9038183 (Takasago Perfumery CO  
20 Ltd.) concerns a deodorant composition capable of removing the smell of bad breath, refrigerator, pets etc. The composition comprise of phenolic compounds and an enzyme which oxidise phenolic compounds. As preferred phenolic compounds the following diphenolic compounds are mentioned: cathecol, catechin compounds, tyrosine and chlorogenic acid. Tyrosinase, peroxidase, glucose  
25 oxidase, and laccase are mentioned as the oxidative enzyme. Preferred enzymes are of mushroom belonging to *Agrinus bisporus* var. *albidus* and *Boletus pulverulentus*. or of fruit origin, such as apple, pear (gobou).

30 US patent no. 3,903,259 concerns a method of deodorising diapers and human excreta comprising applying to the diapers or the excreta a chemical composition which in its simplest form consists of an acidic material, an antibiotic material, and a solvent. The impregnating composition may also contain a  
35 chelating agent and a wetting agent. The treatment of diapers

results in a marked decrease in offensive odours from excreta, thus making the changing of sorted diapers less unpleasant.

US patent no. 3,935,862 discloses a disposable diaper comprising means for inhibiting ammonia formation therein including an aminopolycarboxylic acid compound in an amount of at least 0.001 gm. per square inch.

US patent no. 4,385,632 concerns a germicidal absorbent body for collecting blood, faeces and urine which contains a water-soluble copper salt which impedes bacterial growth, prevents the breaking down of urea into ammonia and complex-binds ammonia so as to prevent the occurrence of unpleasant odour.

US patent no. 4,551,187 describes a deodorant body cleansing composition in the form of a liquid or solid opaque bar, comprising a detergent and a specific carbohydrate capable of reducing the odour-causing bacterial population on the body (skin and/or hair), without the use of anti-microbials. The essential deodorant agent which is a group of carbohydrates specifically effective against the odour-causing bacteria on the skin and/or hair, are mannose, glucose, and oligomers thereof, i.e. dimers, trimers, and tetramers.

US patent no. 5,395,555 concerns an aqueous cleaning composition for carpets, rugs, and textiles particularly useful in reducing malodour of urine stains. The composition comprising a) from about 4.23% to about 4.28% by weight of a sodium or potassium salt of a diethylenetriaminepentaacetic acid, an ethylenediaminetetraacetic acid, a N-hydroxyethylethylenediaminetriacetic acid, or mixtures thereof; b) from about 1.95% to about 2.05% by weight of a diethylenetriaminepentaacetic acid, an ethylenediaminetetraacetic acid, a N-hydroxyethylethylenediaminetriacetic acid, or a mixture thereof; c) from about 0.82% to 0.98% of a sodium lauryl sulfate; d) from about 0.49% to 0.59% by weight of an acrylate copolymer of the formula  $CF_3 (CF_2)_n CH_2 OCOC(CH_3)=CH_2$  wherein n is from 6 to 8; e) from about 0.22% to about 0.27% by weight of an octylphenoxy polyethoxy ethanol; f) from about 0.35% to about 0.5%

by weight of fragrance; and g) from about 0.00003% to about 0.05% by weight of a preservative 1,2-benzisothiazole-3(2H)-ones.

#### SUMMARY OF THE INVENTION

5 It is the object of the present invention to provide improved compositions capable of reducing malodour and products comprising such compositions.

In the first aspect the invention relates to the use of one or more oxidoreductases in combination with a mediator for the  
10 reduction of malodour.

It is also an object of the invention to provide malodour reducing compositions comprising one or more oxidoreductases and a mediator, such as oral care and detergent compositions.

Furthermore the invention relates to a product comprising a  
15 composition of the invention. Contemplated products include oral care products, such as dentifrice, hygiene products, such as a diaper and the like having a malodour reducing composition incorporated in the body fluid material, food products, such as UHT-milk, toiletries product and personal care products and  
20 detergents such as solid and liquid washing detergents.

#### BRIEF DESCRIPTION OF THE TABLES AND DRAWING

Figure 1 shows a control GC chromatogram before the enzyme reaction, (no enzyme, no PPT). The peak 1.28-1.61 indicates the  
25 presence of methanethiol ( $\text{CH}_3\text{SH}$ ).

Figure 2 shows a GC chromatogram obtained after the reaction with enzyme and PPT.

#### DETAILED DESCRIPTION OF THE INVENTION

30 It is the object of the present invention to provide improved compositions capable of reducing malodour and products comprising such malodour reducing compositions.

In the context of the present invention the term "malodour" means an unpleasant bad smell and/or taste/flavour caused by one  
35 of the following types of compounds: VSCs, nitrogen containing

compounds and short fatty acids, or a combination thereof.

The inventors have found that the removal or at least reduction of malodour can be obtained by the use of one or more oxidoreductases in combination with a mediator.

5 The term "reducing the malodour" or "reduced malodour" means that the malodour determined by a test panel is assessed to be less pronounced in comparison to a corresponding blind sample not having been exposed to one or more oxidoreductases and a mediator.

10 Without being limited to any theory it is believed that the mediator sort of link to the volatile sulphur and nitrogen containing compounds resulting in a reaction product which do not have the bad smell. Another theory is that the mediator mediate the linking together of two or more volatile compounds into a  
15 compound without or with reduced bad smell.

#### Oxidoreductases

Oxidoreductases (i.e. enzymes classified under the Enzyme Classification number E.C. 1 (Oxidoreductases) in accordance with  
20 the Recommendations (1992) of the International Union of Biochemistry and Molecular Biology (IUBMB)) which are enzymes catalysing oxidoreductions.

According to the invention three types of oxidoreductases are especially contemplated:

- 25 a) Laccases or related enzymes such as tyrosinase cover enzymes which act on molecular oxygen ( $O_2$ ) and yield water ( $H_2O$ ) without any need for peroxide (e.g.  $H_2O_2$ ),  
b) Oxidases cover enzymes which act on molecular oxygen ( $O_2$ ) and yield peroxide ( $H_2O_2$ ), and  
30 c) Peroxidases cover enzymes which act on peroxide (e.g.  $H_2O_2$ ) and yield water ( $H_2O$ ).

Preferred oxidoreductases are of microbial origin, especially recombinant and/or substantially purified enzymes without any side activity. Microbial enzymes are superior to plant and fruit  
35 enzymes as they can be produced more easily in large amounts by

recombinant techniques known in the art.

Microbial enzyme means in the context of the present invention enzymes derived from bacteria, filamentous fungi or yeasts.

In the case of an enzyme acting on oxygen (O<sub>2</sub>) as the  
5 acceptor, said oxygen may be molecular oxygen supplied by the air.

Also enzyme systems which comprise a combination of the three types of enzymes are contemplated according to the invention. The enzyme systems may e.g. consist of a laccase or a related enzyme  
10 and an oxidase; a laccase or a related enzyme and a peroxidase; a laccase or a related enzyme and an oxidase and a peroxidase; or an oxidase and a peroxidase.

#### Laccase and related enzymes

15 Examples of specifically contemplated enzymes within the group of laccases and related enzymes which are capable of oxidising VSCs and nitrogen compounds in question are mono- and diphenolic oxidases, such as catechol oxidase (1.10.3.1), laccase (E.C. 1.10.3.2), tyrosinase (E.C. 1.14.18.1)(E.C. 1.10.3.1), and  
20 bilirubin oxidase (E.C. 1.3.3.5).

Laccase oxidizes o-diphenol as well as p-diphenol forming their corresponding quinones. Tyrosinase or catechol oxidase catalyses two different reactions: The hydroxylation of monophenols in o-diphenols and the oxidation of o-diphenols in o-  
25 quinones.

Laccases employed may be derived from a strain of *Polyporus* sp., in particular a strain of *Polyporus pinsitus* (also called *Trametes villosa*) or *Polyporus versicolor*, or a strain of *Myceliophthora* sp., e.g. *M. thermophila* or a strain of  
30 *Rhizoctonia* sp., in particular a strain of *Rhizoctonia praticola* or *Rhizoctonia solani*, or a strain of *Scytalidium* sp., in particular *S. thermophilum*, or a strain of *Pyricularia* sp., in particular *Pyricularia oryzae*, or a strain of *Coprinus* sp., such as a *C. cinereus*.

35 The laccase may also be derived from a fungus such as

*Collybia*, *Fomes*, *Lentinus*, *Pleurotus*, *Aspergillus*, *Neurospora*, *Podospora*, *Phlebia*, e.g. *P. radiata* (WO 92/01046), *Coriolus* sp., e.g. *C. hirsutus* (JP 2-238885), and *Botrytis*,

In a preferred embodiment of the invention the laccase is  
5 derived from a strain of *Myceliophthora* sp., especially the *Myceliophthora thermophila* laccase described in WO 95/33836 (from Novo Nordisk).

Bilirubin oxidase may be derived from a strain of *Myrothecium* sp., such as a strain of *M. verrucaria*.

10

#### Peroxidases

Peroxidases must be used in combination with either H<sub>2</sub>O<sub>2</sub> or an oxidase to obtain the desired result, i.e. removal or at least reduction of malodour.

15 Suitable peroxidases can be found within the group of enzymes acting on peroxide as acceptor, e.g. E.C. 1.11.1, especially peroxidase (E.C. 1.11.1.7).

Specific examples of suitable enzymes acting on peroxide as acceptor include peroxidases derived from a strain of the fungus  
20 species *Coprinus*, in particular a strain of *Coprinus cinereus* or *Coprinus macrorhizus*, or derived from a strain of the bacteria genus *Bacillus*, in particular a strain of *Bacillus pumilus*.

Haloperoxidases are also suitable according to the invention. Haloperoxidases form a class of enzymes which are able to oxidise  
25 halides (Cl-, Br-, I-) in the presence of hydrogen peroxide to the corresponding hypohalous acids. A suitable haloperoxidase is derivable from *Curvularia* sp., in particular *C. verruculosa*.

#### Oxidases

30 Oxidases yielding peroxide (H<sub>2</sub>O<sub>2</sub>) must be used in combination with a peroxidase to be able to remove or at least reduce malodour.

Suitable oxidases include glucose oxidase (E.C. 1.1.3.4), hexose oxidase (E.C. 1.1.3.5), L-amino-acid oxidase (E.C.  
35 1.4.3.2), xylitol oxidase, galactose oxidase (E.C. 1.1.3.9),

pyranose oxidase (E.C. 1.1.3.10), alcohol oxidase (E.C. 1.1.3.13).

If a L-amino acid oxidase is used it may be derived from a *Trichoderma* sp. such as *Trichoderma harzianum*, such as the L-amino acid oxidase described in WO 94/25574 (from Novo Nordisk A/S), or *Trichoderma viride*.

A suitable glucose oxidase may originate from *Aspergillus* sp., such as a strain of *Aspergillus niger*, or from a strain of *Cladosporium* sp. in particular *Cladosporium oxysporum*.

Hexose oxidases from the red sea-weed *Chondrus crispus* (commonly known as Irish moss) (Sullivan and Ikawa, (1973), Biochim. Biophys. Acts, 309, p. 11-22; Ikawa, (1982), Meth. in Enzymol. 89, carbohydrate metabolism part D, 145-149) oxidises a broad spectrum of carbohydrates, such as D-glucose, D-galactose, maltose, cellobiose, lactose, D-glucose 6-phosphate, D-mannose, 2-deoxy-D-glucose, 2-deoxy-D-galactose, D-fucose, D-glucuronic acid, and D-xylose.

Also the red sea-weed *Iridophycus flaccidum* produces easily extractable hexose oxidases, which oxidise several different mono- and disaccharides (Bean and Hassid, (1956), J. Biol. Chem, 218, p. 425; Rand et al. (1972, J. of Food Science 37, p. 698-710).

Another suitable group of enzyme is xylitol oxidase (see e.g. JP 80892242) which oxidises xylitol, D-sorbitol, D-galactitol, D-mannitol and D-arabinitol in the presence of oxygen. A xylitol oxidase can be obtained from strains of *Streptomyces* sp. (e.g. *Streptomyces* IKD472, FERM P-14339). Said enzyme has a pH optimum at 7.5 and is stable at pH 5.5 to 10.5 and at temperatures up to 65°C.

In the case of reducing malodour emanating from the oral cavity e.g. by incorporation of an oxidoreductase in an oral care product it is advantageous to use enzymes being substantially active at pHs prevailing in the mouth, i.e. between pH 5.0 to 9.0, preferably between pH 6.0 to 8.5, especially between pH 6.4 to 7.5 and at temperature in the range from 25°C to 40°C.

The term "substantially active" enzyme means in this context that the enzyme(s) has(have) an relative activity (pH-optimum defines 100% at the same conditions) higher than 30%, better 50%, even better more than 70%, such as 80%, and in the best case up to about 100% of the activity at the pH optimum.

### Mediator

According to the invention the one or more oxidoreductases are used in combination with a suitable redox mediator. A so-called "redox mediator" is sometimes in literature referred to as "an enhancing agent". In the present context the term "mediator" will be used.

A "mediator" is an agent capable of enhancing the activity of oxidoreductases.

The mediator may be a phenolic mediator or a non-phenolic mediator. Which mediator is preferred depends of the purpose. If the concept of the invention is to be used for oral care application or a food application the mediator should preferably be non-toxic.

Examples mediators capable of enhancing the activity of oxidoreductases include the compounds described in WO 95/01426, which is hereby incorporated by reference, and described by the general formula I:

The definition of the R1 to R10 and A groups can be found in WO 95/010426 (see p. 9 to 11).

Specifically contemplated compounds within the above formula I include the following: 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonate (ABTS); 6-hydroxy-2-naphtoic acid; 7-methoxy-2-naphtol; 7-amino-2-naphthalene sulfonic acid; 5-amino-2-naphthalene

sulfonic acid; 1,5-diaminonaphthalene; 7-hydroxy-1,2-naphthimidazole; 10-methylphenothiazine; 10-phenothiazine-propionic acid (PPT); N-hydroxysuccinimide-10-phenothiazine-propionate; benzidine; 3,3'-dimethylbenzidine; 3,3'-dimethoxybenzidine; 5 3,3',5,5'-tetramethylbenzidine; 4'-hydroxy-4-biphenylcarboxylic acid; 4-amino-4'-methoxystilbene; 4,4'-diaminostilbene-2,2'-disulfonic acid; 4,4'-diaminodiphenylamine; 2,7-diaminofluorene; 4,4'-dihydroxy-biphenylene; triphenylamine; 10-ethyl-4-phenothiazinecarboxylic acid; 10-ethylphenothiazine; 10-propyl-phenothiazine; 10-isopropylphenothiazine; methyl-10-phenothiazinepropionate; 10-phenylphenothiazine; 10-allyl-phenothiazine; 10-phenoxazinepropionic acid (POP); 10-(3-(4-methyl-1-piperazinyl)propyl)phenothiazine; 10-(2-pyrrolidinoethyl)phenothiazine; 10-methylphenoxazine; imino-15 stilbene; 2-(p-aminophenyl)-6-methylbenzothiazole-7-sulfonic acid; N-benzylidene-4-biphenylamine; 5-amino-2-naphthalenesulfonic acid; 7-methoxy-2-naphtol; 4,4'-dihydroxybenzophenone; N-(4-(dimethylamino)benzylidene)-p-anisidine; 3-methyl-2-benzothiazolinone(4-(dimethylamino)benzylidene)hydrazone; 2-acetyl-20 10-methylphenothiazine; 10-(2-hydroxyethyl)phenothiazine; 10-(2-hydroxyethyl)phenoxazine; 10-(3-hydroxypropyl)phenothiazine; 4,4'-dimethoxy-N-methyl-diphenylamine, vanillin azine.

Other mediator contemplated include 4-hydroxybenzoic acid, L-tyrosine, syringate acids, ferulic acid, sinapic acid, 25 Chlorogenic acid, caffeic acid and esters thereof.

Still further examples include organic compounds described in WO 96/10079, which is hereby incorporated by reference, and by the following formula II:

in which formula A is a group such as -D, -CH=CH-D, -CH=CH-CH=CH-D, -CH=N-D, -N=N-D, or -N=CH-D, in which D is selected from the group consisting of -CO-E, -SO<sub>2</sub>-E, -N-XY, and -N<sup>+</sup>-XYZ, in which E may be -H, -OH, -R, or -OR, and X and Y and Z may be identical or  
5 different and selected from -H and -R; R being a C<sub>1</sub>-C<sub>16</sub> alkyl, preferably a C<sub>1</sub>-C<sub>8</sub> alkyl, which alkyl may be saturated or unsaturated, branched or unbranched and optionally substituted with a carboxy, sulfo or amino group; and B and C may be the same or different and selected from C<sub>m</sub>H<sub>2m+1</sub>; 1 ≤ m ≤ 5.

10 Specific compounds covered by the above formula I are acetosyringone, syringaldehyde, methylsyringate, syringic acid, ethylsyringate, propylsyringate, butylsyringate, hexylsyringate, octylsyringate and ethyl 3-(4-hydroxy-3,5-dimethoxyphenyl)acrylate.

15 Application of the concept invention

The concept/principle of the invention can be used for a vast number of application.

20 Burned flavour

The principle of the invention may also be used for removing burned flavour, a problem known in connection with e.g. UHT-treated milk.

25 Dehairing of hides and skin

During dehairing of hides and skin large amounts of sulfide are usually used. This results in a bad smell caused by VSCs. These VSCs may be reduced according to the invention.

30 Permanent hair waving

Permanent waving of hair involves breaking and/or restoring disulfide cross linkages giving the shape of the kerataneous hair fibers. For this purpose a number of organic reducing agent such as thioglycolic acid, thioactic acid and other sulphur containing  
35 compounds are used. The waving process results in a malodour

caused by VSCs and amines formed as a side-product. Such malodour can be reduced according to the invention.

#### Diapers

5       The malodour removing effect of the combination of one or more oxidoreductases and a mediator can also be used in connection with odour control of body fluids and body gases by incorporation of one or more of the above mentioned oxidoreductases and mediators in hygiene products including  
10       diapers, incontinence products, filters for underwear, garment shields etc.

#### Detergent

      It is also contemplated according to the invention to add one  
15       or more oxidoreductases and a mediator to a detergent composition, e.g., laundry washing powder, a liquid detergent or the like. The remaining malodour caused by short fatty acids may be reduced this way. The malodour reducing system may also be a part of the softener (i.e. fabric softening composition) added  
20       during the washing cycle. Likewise for other detergents such as dish washing detergents.

      The detergent compositions may for example, be formulated as hand and machine laundry detergent compositions including laundry additive compositions and compositions suitable for use in the  
25       pretreatment of stained fabrics, rinse added fabric softener compositions, and compositions for use in general household hard surface cleaning operations and dishwashing operations.

      The detergent composition comprises a lipase, and typically other enzyme activities such as protease activity, as will be  
30       described further below, and a surfactant. Additionally, it may optionally comprise a builder, a suds suppresser, a softening agent, a dye-transfer inhibiting agent and other components conventionally used in detergents such as soil-suspending agents, soil-releasing agents, optical brighteners, abrasives,  
35       bactericides, tarnish inhibitors, coloring agents, and/or

encapsulated or nonencapsulated perfumes.

The detergent composition can be in liquid, paste, gels, bars or granular forms. The pH (measured in aqueous solution at use concentration) will usually be neutral or alkaline, e.g. in the range of 7-11. Granular compositions according to the pre-sent invention can also be in "compact form", i.e. they may have a relatively higher density than conventional granular detergents, i.e. from 550 to 950 g/l.

A lipase or optionally another enzyme incorporated in the detergent composition, is normally incorporated in the detergent composition at a level from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level from 0.0001% to 1% of enzyme protein by weight of the composition, more preferably at a level from 0.001% to 0.5% of enzyme protein by weight of the composition, even more preferably at a level from 0.01% to 0.2% of enzyme protein by weight of the composition.

The amount of lipase protein may be 0.001-10 mg per gram of detergent or 0.001-100 mg per liter of wash liquor. More specifically, the lipase may be incorporated in the detergent compositions described in WO 97/04079, WO 97/07202, WO 97/41212, and PCT/DK 97/00345.

#### Surfactant system:

The surfactant system may comprise nonionic, anionic, cationic, ampholytic, and/or zwitterionic surfactants. The surfactant system preferably consists of anionic surfactant or a combination of anionic and nonionic surfactant, e.g. 50-100 % of anionic surfactant and 0-50 % nonionic. The laundry detergent compositions may also contain cationic, ampholytic, zwitterionic, and semi-polar surfactants, as well as the nonionic and/or anionic surfactants other than those already described herein.

The surfactant is typically present at a level from 0.1% to 60% by weight. Some examples of surfactants are described below.

#### Nonionic surfactant:

The surfactant may comprise polyalkylene oxide (e.g. polyethylene oxide) condensates of alkyl phenols. The alkyl group may contain from about 6 to about 14 carbon atoms, in a straight chain or branched-chain. The ethylene oxide may be present in an amount equal to from about 2 to about 25 moles per mole of alkyl phenol.

The surfactant may also comprise condensation products of primary and secondary aliphatic alcohols with about 1 to about 25 moles of ethylene oxide. The alkyl chain of the aliphatic alcohol can either be straight or branched, and generally contains from about 8 to about 22 carbon atoms.

Further, the nonionic surfactant may comprise polyethylene oxide condensates of alkyl phenols, condensation products of primary and secondary aliphatic alcohols with from about 1 to about 25 moles of ethylene oxide, alkylpolysaccharides, and mixtures hereof. Most preferred are C8-C14 alkyl phenol ethoxylates having from 3 to 15 ethoxy groups and C8-C18 alcohol ethoxylates (preferably C10 avg.) having from 2 to 10 ethoxy groups, and mixtures thereof.

#### Anionic surfactants:

Suitable anionic surfactants include alkyl alkoxylated sulfates which are water soluble salts or acids of the formula  $RO(A)_mSO_3M$  wherein R is an unsubstituted C10-C-24 alkyl or hydroxyalkyl group having a C10-C24 alkyl component, preferably a C12-C20 alkyl or hydroxyalkyl, more preferably C12-C18 alkyl or hydroxyalkyl, A is an ethoxy or propoxy unit, m is greater than zero, typically between about 0.5 and about 6, more preferably between about 0.5 and about 3, and M is H or a cation which can be, for example, a metal cation (e.g., sodium, potassium, lithium, calcium, magnesium, etc.), ammonium or substituted-ammonium cation. Alkyl ethoxylated sulfates as well as alkyl propoxylated sulfates are contemplated herein. Specific examples of substituted ammonium cations include methyl-,

dimethyl, trimethyl-ammonium cations and quaternary ammonium cations such as tetramethyl-ammonium and dimethyl piperdinium cations and those derived from alkylamines such as ethylamine, diethylamine, triethylamine, mixtures thereof, and the like.

5 Other suitable anionic surfactants include the alkyl sulfate surfactants which are water soluble salts or acids of the formula  $ROSOM$  wherein R preferably is a C10-C24 hydrocarbyl, preferably an alkyl or hydroxyalkyl having a C10-C20 alkyl component, more preferably a C12-C18 alkyl or hydroxyalkyl, and M is H or a  
10 cation, e.g., an alkali metal cation (e.g. sodium, potassium, lithium), or ammonium or substituted ammonium.

Other anionic surfactants include salts (including, for example, sodium, potassium, ammonium, and substituted ammonium salts such as mono- di- and triethanolamine salts) of soap, C8-  
15 C22 primary or secondary alkanesulfonates, C8-C24 olefinsulfonates, sulfonated polycarboxylic acids prepared by sulfonation of the pyrolyzed product of alkaline earth metal citrates.

Alkylbenzene sulfonates are suitable, especially linear  
20 (straight-chain) alkyl benzene sulfonates (LAS) wherein the alkyl group preferably contains from 10 to 18 carbon atoms.

The laundry detergent compositions typically comprise from about 1% to about 40%, preferably from about 3% to about 20% by weight of such anionic surfactants.

25

Builder system:

The compositions according to the present invention may further comprise a builder system. Any conventional builder system is suitable for use herein including aluminosilicate  
30 materials, silicates, polycarboxylates and fatty acids, materials such as ethylenediamine tetraacetate (EDTA), metal ion sequestrants such as aminopolyphosphonates. Phosphate builders can also be used herein.

Suitable builders can be an inorganic ion exchange material,  
35 commonly an inorganic hydrated aluminosilicate material, more

particularly a hydrated synthetic zeolite such as hydrated zeolite A, X, B, HS or MAP.

Detergency builder salts are normally included in amounts of from 5% to 80% by weight of the composition. Preferred levels of  
5 builder for liquid detergents are from 5% to 30%.

#### Other enzymes

The detergent composition may besides the lipase comprise other enzyme(s) providing cleaning performance and/or fabric care  
10 benefits, e.g. proteases, lipases, cutinases, amylases, cellulases, peroxidases, oxidases (e.g. laccases).

Suitable proteases include those of animal, vegetable or microbial origin. Microbial origin is preferred. Chemically or genetically modified mutants are included. The protease may be a  
15 serine protease, preferably an alkaline microbial protease or a trypsin-like protease. Examples of alkaline proteases are subtilisins, especially those derived from *Bacillus*, e.g., subtilisin Novo, subtilisin Carlsberg, subtilisin 309, subtilisin 147 and subtilisin 168 (described in WO 89/06279) and variants  
20 thereof.

#### Bleaching agents:

The detergent composition (especially in the case of a granular detergent) may also comprise a bleaching agents, e.g. an  
25 oxygen bleach or a halogen bleach. The oxygen bleach may be a hydrogen peroxide releasing agent such as a perborate (e.g. PB1 or PB4) or a percarbonate, or it may e.g. be a percarboxylic acid. The particle size may be 400-800 microns. When present, oxygen bleaching compounds will typically be present at levels of  
30 from about 1% to about 25%.

The hydrogen peroxide releasing agent can be used in combination with bleach activators such as tetraacetythylenediamine (TAED), nonanoyloxybenzene-sulfonate (NOBS), 3,5-trimethyl-hexsanoyloxybenzene-sulfonate (ISONOBS) or  
35 pentaacetylglucose (PAG).

The halogen bleach may be, e.g. a hypohalite bleaching agent, for example, trichloro isocyanuric acid and the sodium and potassium dichloroisocyanurates and N-chloro and N-bromo alkane sulphonamides. Such materials are normally added at 0.5-10% by weight of the finished product, preferably 1-5% by weight.

#### Food malodour

Foodstuffs such as fish, meat and the like give a malodour primarily caused by nitrogen containing compounds. The amine trimethylamine which is known to give a fishy smell can be reduced according to the invention.

#### Waste water/and gas

The concept of the invention can also be used for removal of amines and VSCs in waste water and exhaust gasses.

#### Toiletries

The use of the malodour reducing system of the invention as an active ingredient in toiletries, bath and shower products, including shampoos, conditioners, lotions, creams, soap bars, toilet soaps, and liquid soaps and other personal care products are also contemplated. The development of body malodour is believed largely to be due to bacterial action on the products of sweat glands.

#### Cleaning compositions

Another application where the principle of the invention can be used is in cleaning composition for carpets, rugs, garment, textiles and the like.

The practical incorporation of the concept of the invention as defined in the claims can easily be carried out by a skilled person. A person skilled in the art can easily adapt the concept of the invention to specific types products where malodour control or removal or reduction of malodour are known to be

desired.

#### Composition

In a second aspect the invention relates to a malodour  
5 removing or reducing composition comprising one or more  
oxidoreductases and a mediator.

The oxidoreductases and the mediator may be the ones  
disclosed above in connection with the first aspect of the  
invention.

10

#### Oral care

A composition of the invention may be used in oral care  
products.

An oral care product according to the invention capable of  
15 removing malodour emanating from the oral cavity may have any  
suitable physical form (i.e. powder, paste, gel, liquid, oint-  
ment, tablet etc.).

An "oral care product" can be defined as a product which can  
be used for maintaining or improving the oral hygiene in the  
20 mouth of humans and animals, by e.g. preventing dental caries,  
preventing the formation of dental plaque and tartar, removing  
dental plaque and tartar, preventing and/or treating dental dis-  
eases, removing malodour etc.

Oral care products do also encompass products for cleaning  
25 dentures, artificial teeth and the like.

Examples of oral care products include toothpaste, dental  
cream, gel or tooth powder, odontic, mouth washes, pre- or post  
brushing rinse formulations, chewing gum, lozenges, and candy.

Toothpastes and tooth gels typically include abrasive  
30 polishing materials, foaming agents, flavouring agents, humec-  
tants, binders, thickeners, sweetening agents, white-  
ning/bleaching/ stain removing agents, water, and optionally  
enzymes.

Mouth washes, including plaque removing liquids, typically  
35 comprise a water/alcohol solution, flavour, humectant, sweetener,

foaming agent, colorant, and optionally enzymes.

### Product

5 In the third aspect the invention relates to products comprising a malodour removing or reducing composition of the invention.

The composition of the invention may be used in oral care products such as dentifrice, toiletries, detergents, fabric softeners, foods.

10 Other examples of contemplated products include hygiene products, such as diapers, adult incontinence products, training pants, feminine napkins, tampons; toiletry products, such as soap bars and the like; products for removing burned flavour from foods, such as milk etc.

15 According to the invention the product may be a one or a two compartment product. In the one compartment product the oxidoreductase, the mediator and other ingredients are keep together in a stabilised solution or kept under stable conditions (i.e. so that no oxygen is present). In a two compartment product  
20 the oxidoreductase and the mediator and other ingredients are keep in two containers keep apart. The contents of said containers are mixed before use.

**METHODS AND MATERIALS****Materials:**Enzyme:Laccases

- 5        Recombinant laccase from *Myceliophthora thermophila*  
         (rMtL) (available from Novo Nordisk) and described in WO 95/33836  
         (Novo Nordisk).

         Recombinant *Coprinus cinereus* laccase (rCcL).

         Recombinant *Polyporus pinsitus* laccase (rPpL).

10

Tyrosinase

         Tyrosinase T-7755 from Mushroom/Sigma.

Peroxidase

- 15        Recombinant *Coprinus cinereus* peroxidase (rCiP)  
         Horse radish peroxidase Type I /Sigma P-8125  
         Horse radish peroxidase Type XII /Sigma P-8415  
         Acid horse radish peroxidase : RZ 2.5, pI 4, 5.3, 5.85 and  
         6.0. Does not bind to benzhydroxonic acid agarose.

20

Reagents:

         Mediator: 10-phenothiazine-propionic acid (PPT);

         10-phenoxazinepropionic acid (POP); caffeic acid;

         Chlorogenic acid; L-Tyrosine; p-hydroxybenzoic acid;

- 25        Syringaldehyde; Methylsyringate.

         Sodium methanethiolate (purchased from Fluka)

         Buffer: Britten-Robinson buffer at pH indicated in the  
         examples.

- 30        GC Chromatograph:

         Column : 6 ft x 1/8 in. o.d. teflon column packed with  
         40/60 mesh carbopack BHT-100 (Supelco).

         Detector : Flame Photometric Detector ( FPD ) (Hewlett  
         Packard) Air flow :100 ml /min (350 kPa)

H<sub>2</sub> : 75 ml/min ( 150 kPa)

Carrier + make-up : 30 ml/min ( 130 kPa)

Chromatographic conditions:

5 30 ml/minute of N<sub>2</sub> and He

Injector temperature 150°C

Detector temp. 200°C

Initial oven temp. 35°C

Initial time 2.5 minute

10 Rate 10°C/minute

Final temp 140°C

**Methods**

Determination of Laccase Activity (LAMU)

15 The LAMU method is used for determining the activity of  
*Myceliophthora thermophila* laccase.

Laccase (E.C. 1.10.3.2), *p*-diphenol: O<sub>2</sub> oxidoreductase, containing copper in the prosthetic group, uses molecular oxygen as a final electron acceptor. Atmospheric oxygen is  
20 directly reduced to 2 H<sub>2</sub>O, during liberation of 4 electrons,  
without hydrogenperoxide being an intermediate step.

Laccase will under aerobic conditions catalyse the oxidation of syringaldazine forming tetramethoxy-azo bis methylene quinone.

25

Tyrosinase activity:

The activity and specific activity of tyrosinase defined according to Duckworth, H. W. and Coleman, J. E. ( 1970) J. Biol. Chem. 245, 1613-1625, was used to calculate the amount of  
30 enzyme protein.

**R action c nditi ns**

Substrate : Syringaldazine 19 mM  
35 Buffer : Tris 23 mM

pH : 7.50  
Temperature : 30°C  
Time of reaction : 90 seconds.  
Enzyme working area : 0.0016 - 0.0064 LAMU/ml  
5 Wavelength : 530 nm  
Water : MilliQ

#### Definition of units

One LAMU, is the amount of enzyme which under the given  
10 analytical conditions transforms 1  $\mu$ mol syringaldazine per  
minute.

#### SPECIFICITY AND SENSITIVITY

Limit of detection LOD: 0.007 LAMU/ml  
15 Limit of quantification LOQ: 0.07 LAMU/ml  
Range: 0.100 - 0.400 ABS/min.

#### REAGENTS/SUBSTRATES

##### Maleic acid, 1.0 M

20 Maleic acid 37% paM \*) 800380 23.2 g  
Demineralized water, Milli Q.....up to 200 ml  
23.2 g Maleic Acid is weighed in a weighing boat and added 150  
ml water during continuously stirring. Stir until dissolved.  
Transfer quantitatively the solution to a 200 ml volumetric  
25 flask and add up to the mark with water.

\*) pro analysi Merck

##### Tris buffer 1.0 M; Stock solution

Tris[hydroxymethyl]aminomethane Sigma T-1378.....121.1 g  
30 Demineralized water, Milli Q .....up to 1 l  
Tris buffer is weighed in a weighing boat and 800 mL of water  
is added during continuously stirring. Stir until dissolved.  
Transfer quantitatively the solution to a 1 l volumetric  
flask and add up to the mark with water.

**Tris buffer 25 mM; pH 7.50**

Tris buffer 1.0 M..... 25.0 ml

Maleic acid , 1.0 M.....5.0 ml

5 Demineralized water.....up to 1 l

pH is adjusted to  $7.50 \pm 0.05$ .

Pour 50 ml Tris buffer 1.0 M (graduated glass) into a 1 l volumetric flask and add about 700 ml water. Now add 5 ml Maleic acid, 1 M. Adjust pH to  $7.50 \pm 0.05$  and add up to the mark with water. (pH may not be adjusted with HCl, because of the inhibiting effect on the Laccase-enzyme.)

**Dilution media**

PEG 6000 paM 807491 .....25.0 g

15 Triton X-100, Sigma T-9284 .....5.0 g

Milli Q water up to.....0.5 l

25.0 g PEG 6000 and 5.0 g Triton X-100 is weighed in a weighing boat and added 400 ml water during continuous stirring. Stir until dissolved.

20 Transfer quantitatively the solution to a 0.5 l volumetric flask and add up to the mark with water.

**Syringaldazine, 0.56 mM; Stock solution**

Syringaldazine anh Sigma S-7896 .....10.0 mg

25 Ethanol 96%.....50 ml

Syringaldazine is weighed in a 50 ml volumetric flask and added ethanol of 50 ml. Is stirred until dissolved (appr. 3 hours). The reagent is sensitive to light. Should be contained in a dark bottle.

30

**Syringaldazine, 0.28 mM; 48% ethanol**

Syringaldazine, 0.56 mM .....25.0 ml

Demineralized water, Milli Q .....up to 50 ml

25 ml syringaldazine, 0.56 mM (full pipette) is transferred to a 50 ml volumetric flask. Fill up to the mark with water.

35

**Check of the Reagent: Syringaldazine, 0.056 mM; 48% Ethanol:**

Syringaldazine, 0.28 mM .....2 ml

Ethanol, 96 % 4 ml

5 Demineralized water, Milli Q .....up to 10 ml

The solution should have an absorption of about 2.2 at 360 nm. measured against ethanol, 6%.

**Ethanol, 6%**

10 Ethanol, 96% 62.5 ml

Demineralized water, Milli Q .....up to 1000 L

62.5 ml ethanol, 96% (graduated glass) is transferred to a 1 l volumetric flask. Fill up to the mark with water.

15 **SAMPLES AND STANDARDS**

**Control**

The analyses are compared to a well known laccase sample in order to control the level of the assay. The sample is a representative laccase batch.

20

**Unknown samples**

The Laccase samples are diluted to an expected activity of 0.18 LAMU/ml with the dilution media. Let the samples rest for 15 minutes before analysis.

25

Working area: 0.07 - 0.28 LAMU/ml.

Other samples with precipitate are centrifuged at about 3000 rpm. for 10 minutes.

30 **PROCEDURE**

Reagents and standards are made. The samples are weighed and diluted to an expected activity at 0.18 LAMU/ml.

4 ml Tris buffer, 25 mM; pH 7.5 is preheated in at least 10 minutes at 30°C. A 100 ml sample is added. Mixing. 300 ml  
35 syringaldazine, 0.28 mM is added whereby the reaction is star-

ted. Mixing.

The sample is mounted into the photometer, on which afterwards the kinetic sequence at 530 nm is read, and a change in absorption is calculated per minute from **t90 sec. - t60**  
5 **sec..** See table 1 below. Between each sample the photometer cuvette is rinsed with a 6% ethanol solution.

Tris buffer 25 mM; pH 7.5 (reagent 6.3)	4.00 ml
Heating, 10 minutes, 30 °C	
Enzyme	100 ml
Mixing	
Syringaldazine 0.28 mM (reagent 6.6)	300 ml
Mixing	
Reading t=90 sec. at 530 nm	
Calculation: t90 sec. -t60sec.	
Rinse with 6% ethanol	

Table 1. Procedure for laccase

## 5 CALCULATION

$$\Delta \text{ABS} \times 0.677 \times D = \text{LAMU} / \text{mL}$$

$$\frac{\Delta \text{ABS} \times 4.4 \times 10^{-3}}{0.065 \times 0.1} \times D = \text{LAMU} / \text{mL}$$

Where:

- $\Delta \text{ABS}$ : change in absorption per minute.  
 4.4: total volume in ml.  
 0.1: assay volume in ml.  
 10 0.065: m molar extinction coefficient.  
 $10^{-3}$ : LAMU/l  $\rightarrow$  LAMU/ml.  
 D: Further dilution.

**EXAMPLES****EXAMPLE 1**Control experiment of sniffing test

5 Threshold of sensory test against methanethiol was performed. The known concentration of sodium methanethiolate was prepared in a Britton-Robinson buffer pH 6.5. 2.0 ml of each solution was poured to 20 ml glass bottle. The trained subjects gave score.

10 As shown in the table below, when score 0 or "no odour" is given to a sample, more than 95% of methanethiol is removed.

NaSCH <sub>3</sub>	0.11 (reference)	0.055	0.027	0.013	0.006	0.003
Score	4	4	3	2	1	1

Score:

- 4: Reference or odour as reference
- 15 3: Clear odour
- 2: Weak odour
- 1: Very weak odour
- 0: No odour

**EXAMPLE 2**Reduction of malodour (VSC) with laccase and PTT as mediator

0.5 µl of 15 % sodium methane thiolate (CH<sub>3</sub>SNa) (0.11 mM) was added to 10.0 ml of 40 mM Britton-Robinson buffer pH 6.0 in a closed 50 ml container.

25 500 µM PPT and 5 LAMU/ml *Myceliophthora thermophila* laccase were added to the mixture and incubated at 37°C for 30 minutes. The reaction mixture was shaken manually during incubation.

After the enzyme reaction, 0.1 ml of a gas sample was taken from the head space and GC analysed. A control was made without  
30 the laccase and the PPT.

A GC-sniff showed that the first peak at 1 min in a control

(Fig. 1) was  $\text{CH}_3\text{SH}$ .

As can be seen from the chromatograms (Figure 1 and Figure 2),  $\text{CH}_3\text{SH}$  peak completely disappeared after the enzyme reaction reflecting that the methanethiol malodour had disappeared.

5

#### Sniffing Tests

1. Methanethiol ( $\text{CH}_3\text{SH}$ ) has characteristic odour. After the enzyme reaction the odour was tested by sniffing to the reaction mixture. The malodour had disappeared which indicates that more than 95% of the  $\text{CH}_3\text{SH}$  was removed.

10

#### Example 3

##### Reduction of malodour (VSC) with laccase and PPT and POP as mediators.

15        2  $\mu\text{l}$  of 15 % sodium methanethiolate (0.11 mM) was added to 2.0 ml of 40 mM Britton-Robinson buffer in a closed 50 ml container.

The *Myceliophthora thermophila* laccase and either PPT or POP were added according to the table below. The mixture (total volume 2.0 ml) was hand shaken for 10 minutes at room temperature. Malodour was scored.

20

Enzyme	Mediator 500 $\mu\text{M}$	pH	Malodour
0	none	5.5	+++ strong methanethiol odour
0	none	6.0	+++ strong methanethiol odour
5 LAMU/ml	PPT	5.5	+ some methanethiol odour
0	PPT	5.5	+++ strong methanethiol odour
5 LAMU/ml	POP	5.5	$\pm$ no methanethiol odour
0	POP	5.5	+++ strong methanethiol odour
5 LAMU/ml	PPT	6.0	$\pm$ no methanethiol odour
0	PPT	6.0	+++ strong methanethiol odour

5 LAMU/ml	POP	6.0	± no methanethiol odour
0	POP	6.0	+++ strong methanethiol odour

PPT, POP and the laccase gave no odour

As can be seen from the Table laccase in combination with a mediator reduced the VSC malodour significantly.

#### 5 Example 4

##### Reduction of in vitro oral malodour (VSC)

Tongue plaque was collected from a subject and cultivated in the Brain Heart Infusion (BHI) medium at 37°C overnight. 0.5 ml culture broth was mixed with 0.5 ml 40 mM Britton-Robinson buffer, pH 6.0, in a 20 ml volume glass container. 500 µM PPT or POP and 5 LAMU/ml *Myceliophthora thermophila* laccase were added to a mixture according to the table below. It was hand shaken for 10 minutes at room temperature. Malodour was scored.

Enzyme	Mediator 500 µM	pH	Malodour
0	none	6.0	++ strong volatile sulphur odour
5 LAMU/ml	PPT	6.0	+ fruity, rather pleasant odour
0	PPT	6.0	++ strong volatile sulphur odour
5 LAMU/ml	POP	6.0	+ fruity, rather pleasant odour
0	POP	6.0	++ strong volatile sulphur odour

15

#### Example 5

##### Reduction of malodour (trimethylamine)

5 LAMU/ml *Myceliophthora thermophila* laccase and 25 µl trimethylamine were added to 10.0 ml of 40 mM Britton-Robinson buffer, pH 6.0, in a 50 ml volume glass bottle. The bottles were sealed with rubber cap. The reaction was started by adding 500 µl PPT mediator. Reaction time was 30 minutes at 37°C. The bottles were shaken manually during reactions. The malodour was

scored by a panel of three persons.

Enzyme	Mediator 500 $\mu$ M	Malodour source	Score
0	PPT	Trimethylamine	++ distinct fishy odour
5 LAMU/ml	PPT	Trimethylamine	$\pm$ almost no odour

PPT and the laccase alone did not give any odour.

- 5 As can be seen of the table above almost all malodour caused from the trimethylamine disappeared after subjection to a mixture of laccase and PPT mediator.

#### Example 6

##### 10 Reduction of malodour (short fatty acids)

- 5 LAMU/ml *Myceliophthora thermophila* laccase and 10  $\mu$ l butyric acid were added to 10.0 ml of 40 mM Britton-Robinson buffer, pH 6.0, in a 50 ml volume glass bottle. The bottles were sealed with rubber cap. The reaction was started by adding  
 15 500  $\mu$ l PPT mediator. Reaction time was 30 minutes at 37°C. The bottles were shaken manually during reactions. The malodour was scored by a panel of three persons.

Enzyme LAMU/ml	Mediator 500 $\mu$ M	Malodour source	Score
0	PPT	Butyric acid	++ distinct odour
5	PPT	Butyric acid	+ less odour than none-enzymatic treatment.

PPT and the laccase alone did not give any odour.

20

#### Example 7

##### Reduction of malodour (VSC) with various mediators

The ability to remove the malodour caused by methanethiol was tested using

1  $\mu$ l of 1.5 % methanethiol solution (0.11 mM) was added to a total volume of 2.0 ml of 20 mM Britton-Robinson buffer, pH 6.5, in a closed 20 ml glass bottle.

5 5 LAMU/ml *Myceliophthora thermophila* laccase and the mediator were added and reacted for 30 minutes at 37°C under

The reaction conditions : 37 °C, 30 minutes, manual shaking during reactions

	No enzyme	<i>Myceliophthora thermophila</i> laccase 5 LAMU/ml
Mediator (500 $\mu$ M)	Sniffing score	Sniffing score
none	++	++
caffeic acid	++	-
Chlorogenic acid	++	-
L-Tyrosine	++	+
p-hydroxybenzoic acid	++	+
Syringaldehyde	++	-
Methylsyringate	++	-
PPT	++	-

-: no methanethiol odour

10 +: reduced methanethiol odour

++: strong methanethiol odour

### Example 8

#### Reduction of cooked flavour from UHT-milk

15 Two 10 ml samples of UHT-milk was treated as follow:

	Chlorogenic acid (mM)	Laccase (LAMU/l)	Temp. (°C)	Time (min)
Experimental sample	0.1	10	40	30
Control	0.1	none	40	30

The UHT-milk used was skimmed milk treated at 140°C (available from Kløver Mælk A.m.b.a., Frederikcia, Denmark).

The laccase used was derived from *Myceliophthora thermophila*,  
5 activity: 3760 LAMU/g (available from Novo Nordisk A/S, Denmark)

The sample was also added chlorogenic acid as mediator.

The oxygen concentration in UHT-milk was measured to 0.94 mg/l by using a Clark oxygen electrode (Rank Brothers, GB) and Oximeter Oxi 3000 (Wissenschaftliche Werkstätten G.m.b.H., DE).  
10 Propanal, butanal, hexanal, nonanal and di methyl sulphide was identified by GS-MS (Gas/Mass spectrometry) using a head space trapping (Büchi, Rotavapor R-134 with a purge and trap Concentrator auto sampler and sample pocket heater type Tekmar) coupled to Gas Chromatography-Mass spectrometry equipment (Hewlett  
15 Packard G1800A GCD system). A pronounced cooked flavour was identified by a panel of 7 assessors.

The subsequent analysis of the samples showed that all of the above compounds had disappeared in the experimental sample while still being present in the control sample.

20 No cooked flavour could be identified by the sensory panel in the experimental sample while still found very pronounced in the control sample.

#### Example 9

25 Comparison experiments between *Myceliophthora thermophila* laccase and Mushroom Tyrosinase

A: 10 µl of 0.15 % sodium methanethiol solution (0.11 mM) was mixed with 500 µM mediator (final concentration) (0.5% Oolong tea extract when used) and 20 mM Britton-Robinson buffer (final  
30 concentration), pH 6.5 in 20 ml glass bottles to a total volume of 2.0 ml.

The bottles allowed to stand for 5 minutes at 37 °C. Malodour was scored.

Enzymes were added and mediators used according to the table below.

Mediator (500 $\mu$ M or 5%)	Dosage mg enzyme protein/ml	rMtL	Tyrosinase
Chlorogenic acid	0.005	0	3
	0.01	0	2
Methylsyringate	0.1	0	4
Oolong tea extract	0.1	0	3

5

#### Ranking

4: Reference or odour as reference

3: Clear odour

10 2: Weak odour

1: Very weak odour

0: No odour

15 B: Instead of sodium methanethiol 1 ml of the cultivated tongue plaque was used. Tongue plaque was collected from two subjects and inoculated in BHI (air was replaced with nitrogen). The inoculated plaque was cultivated overnight at 37°C.

The results are shown below.

Mediator	Dosage mg enzyme protein/ml	rMtL	Tyrosinase
Chlorogenic acid	0.1	2	3

20

As shown in the tablets, rMt laccase is more effective at removing malodour than Mushroom tyrosinase on enzyme protein weight basis.

5

**Example 10****Reaction of rMt laccase, the mushroom tyrosinase and the mediators**

500  $\mu$ m mediator (except that the Oolong tea was 0.5%), 0.11mM sodium methanethiol, 20 mM Britton-Robinson buffer, pH 6.5 was mixed in the same amounts and under the same conditions as in example 9.

$\Delta$ Absorbance/min/mg enzyme protein was measured at 400 nm. The result with different mediators is shown in the table below.

15

$\Delta$ Absorbance/min/mg enzyme protein

	rMt laccase	Tyrosinase
Chlorogenic acid	21.8	1.49
Syringaldehyde	0.16	0.016
Methylsyringate	1.04	0.015
Oolong tea extract	1.35	0.03

As can be seen from the table rMt laccase develops colour more effectively than the mushroom tyrosinase, which indicates that rMt laccase produces a reactive o-quinone compound more effectively than the mushroom tyrosinase.

The results is obtained by dosing 0.01-0.2 mg/ml enzyme protein to 0.11 mM sodium methanethiol, 500 mM chlorogenic acid and 40 mM Britton-Robinson buffer, pH 6.5 at room temperature.

25

**Example 11****Comparison between rKt, rPp, rCc Laccase and Mushroom Tyrosinase (Sigma)**

The mixtures from example 8A was added enzymes according to the table below. Malodour was scored by a panel after 5 minute at 37°C.

5

Donor ( 500µM or 0.5% )	Dosage mg enzyme protein/ml	Effect Ranking			
		rCcL	rPpL	rMtL	Tyrosina se
Chlorogenic acid	0.01	0	0	0	3

#### Ranking

- 4: Reference or odor as reference
- 10 3: Clear odor
- 2: Weak odor
- 1: Very weak odor
- 0: No odor

- 15 As shown in the table, the different laccases were more effective at removing malodour than Mushroom tyrosinase on enzyme protein weight basis.

#### Reaction of rMt laccase, the mushroom tyrosinase and the donors

- 20 500 µm mediator (except that the Oolong tea was 0.5%), 0.11mM sodium methanethiol, 20 mM Britton-Robinson buffer, pH 6.5 was mixed in the same amounts and under the same conditions as in example 9.

ΔAbsorbance/min/mg enzyme protein was measured at 400 nm.

- 25 The result with different enzymes is shown in the table below.

5

	$\Delta$ Absorbance/min/mg enzyme protein at 400 nm			
	rCcL	rPpL	rMtL	Tyrosinase
Chlorogenic acid*	7,01	21,6	26,2	1,04

As shown in the table, the laccases developed colour more effectively than the mushroom tyrosinase, which indicates that the laccases produces a reactive o-quinone compound more effectively than the mushroom tyrosinase.

**Example 12**Comparison between peroxidase and laccase

10  $\mu$ l of 0.15 % sodium methanethiol solution (0.11 mM) was mixed with 500  $\mu$ M chlorogenic acid and 20 mM Britton-Robinson buffer, pH 6.5 in 20 ml glass bottles to a total volume of 2.0 ml. In the case where peroxidases was used 1 mM hydrogenperoxid was added

The bottles allowed to stand for 5 minutes at 37 °C. Malodour was scored.

Enzymes were added according to the table below.

	mg enzyme protein/ml			
	$10^{-3}$	$10^{-4}$	$10^{-5}$	$10^{-6}$
rMtL	-	+	N.D.	N.D.
rCiP	-	-	+	+
Horse radish P-8125	-	-	-	+

Horse radish P-8415	-	-	-	+
Acid horse radish	-	-	-	+

Odour ranking:

- : No odour

5. + : Odour

N.D. : Not done

As shown in the table, the peroxidases were as effective as laccase at removing malodour but at a lower concentration.

10

#### Reaction of rMt laccase and peroxidases with chlorogenic acid

The  $\Delta$ absorbance of solutions containing 500  $\mu$ M chlorogenic acid, 1 mM hydrogen peroxide (only for the peroxidases), 0.11 mM sodium methanethiol, 20 mM Britton-Robinson buffer pH 6.5 at  
15 room temperature and different enzymes was measured at 400 nm.

#### Peroxidase:

	$\Delta$ Absorbance/min/mg enzyme protein at 400 nm			
	rCiP	Horse radish P-8125	Horse radish P-8415	Acid horse radish
Chlorogenic acid	9480	11800	14200	18600

Laccase and Tyrosinase:

	$\Delta$ Absorbance/min/mg enzyme protein at 400 nm			
	rCcL	rPpL	rMtL	Tyrosinase
Chlorogenic acid*	7,01	21,6	26,2	1,04

As shown in the tables, the peroxidases developed colour  
5 more effectively than the laccases and the mushroom tyrosinase,  
which indicates that the peroxidases produces the reactive o-  
quinone compound more efficiently. The table also shows that  
laccase developes colour more effectively than tyrosinase.

**PATENT CLAIMS**

1. Use of one or more oxidoreductases in combination with a mediator for the reduction of malodour.
- 5 2. The use according to claim 1 wherein the oxidoreductase is of microbial, such as bacteria, filamentous fungus or yeast origin.
3. The use according to claims 1 or 2 wherein the oxidoreductase  
10 is a laccase or a related enzyme, an oxidase or a peroxidase, or a mixture thereof.
4. The use according to claim 3 wherein the oxidoreductase is a laccase, an oxidase or a peroxidase.
- 15 5. The use according to claim 3 or 4 wherein the oxidoreductase is a laccase derived from *Myceliophthora* sp., in particular *M. thermophila* or from *Polyporus* sp., in particular *P. pinsitus*.
- 20 6. The use according to claim 3 or 4 wherein the oxidoreductase is a peroxidase derived from *Coprinus* sp., in particular *C. cinereus* or Horse radish peroxidase.
7. The use according to any of claims 1 to 6 wherein the mediator  
25 is a phenolic compound or a none phenolic compound.
8. The use according to any of claims 1 to 7, wherein the mediator is none toxic.
- 30 9. A malodour reducing composition comprising one or more oxidoreductases and a mediator.
10. The composition according to claim 9 wherein the oxidoreductase(s) is(are) (an) enzyme(s) according to any of  
35 claims 1 to 6 and the mediator is a compound according to any of

claims 7 to 8.

11. The composition according to claims 9 and 10, further comprising ingredients used in detergents.

5

12. The composition according to claim 11, being a detergent comprising a lipase as an active ingredient.

10 13. A product comprising a composition according to any of claims 9 to 12.

14. The products according to claim 13, being an oral care products, such as a dentifrice, in particular a toothpaste or a mouthwash.

15

15. The product according to claim 14, being a hygiene product, such as a diaper, an adult incontinence product, training pants, feminine napkin, tampon.

20 16. The product according to claim 13 being a product for removing burned flavour.

17. The product according to claim 13 being a toiletry product, such as soap.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/DK 98/00353

## A. CLASSIFICATION OF SUBJECT MATTER

IPC6: C12N 9/02, C11D 3/386, A61K 7/28, A61L 15/38

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC6: C12N, A61K, A61L

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

SE,DK,FI,NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

WPI, EPODOC

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	WO 9527046 A2 (UNILEVER N.V.), 12 October 1995 (12.10.95), abstract, claims --	1-17
Y	WO 9610079 A1 (NOVO NORDISK A/S), 4 April 1996 (04.04.96), abstract, claims -- -----	1-17

☐ Further documents are listed in the continuation of Box C. ☒ See patent family annex.

\* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family
